Experiment 6

Student Name: Tanureet Kaur **UID: 23BCS11761**
Branch: BE CSE **Section/Group: KRG 3A**
Semester: 6th **Date of Performance: 02/03/26**
Subject Name: Full Stack Development **Subject Code: 23CSH-309**

Aim:

To design and implement a Spring Boot REST API using Layered Architecture, applying Inversion of Control (IoC) and Dependency Injection (DI) to build a structured backend for the HealthHub application, including CRUD operations, DTO mapping, validation, and global exception handling.

Objective:

After completing this experiment, students will be able to:

1. Understand Spring Boot fundamentals
   - Learn the role of Spring Boot in backend development.
   - Configure and run a basic Spring Boot application.

2. Apply IoC and Dependency Injection
   - Understand how Spring manages object creation and dependencies.
   - Use annotations like @Autowired, @Service, and @Repository.

3. Implement Layered Architecture
   - Structure the application using Controller, Service, and Repository layers.
   - Understand separation of concerns in backend design.

4. Develop RESTful APIs
   - Create CRUD operations using Spring Boot REST controllers.
   - Design APIs using proper HTTP methods (GET, POST, PUT, DELETE).

5. Use DTOs for API communication
   - Implement DTO mapping to separate internal models from API responses.

6. Implement Validation
   - Apply validation using Jakarta Validation annotations (@NotNull, @Email, etc.).

7. Handle Exceptions Globally
   - Implement global exception handling using @ControllerAdvice.

8. Build the HealthHub Backend Module
   - Develop backend services for patient/health record management.

Implementation/Code:

PatientController.java:

```
package com.example.healthhub.controller;

import com.example.healthhub.dto.PatientDTO;
import com.example.healthhub.entity.Patient;
import com.example.healthhub.service.PatientService;
import jakarta.validation.Valid;
import org.springframework.beans.factory.annotation.Autowired;
import org.springframework.web.bind.annotation.*;

import java.util.List;

@RestController
@RequestMapping("/patients")
public class PatientController {

    @Autowired
    private PatientService service;

    @PostMapping
    public Patient create(@Valid @RequestBody PatientDTO dto){
```

```
        Patient patient = new Patient();
        patient.setName(dto.getName());
        patient.setEmail(dto.getEmail());
        patient.setAge(dto.getAge());

        return service.save(patient);
    }

    @GetMapping
    public List<Patient> getAll(){
        return service.getAll();
    }

    @GetMapping("/{id}")
    public Patient getById(@PathVariable Long id){
        return service.getById(id);
    }

    @DeleteMapping("/{id}")
    public void delete(@PathVariable Long id){
        service.delete(id);
    }
}
```

PatientRepository.java:

```
package com.example.healthhub.repository;

import com.example.healthhub.entity.Patient;
import org.springframework.data.jpa.repository.JpaRepository;

public interface PatientRepository extends JpaRepository<Patient, Long> {
}
```

PatientService.java:

```
package com.example.healthhub.service;

import com.example.healthhub.entity.Patient;
import com.example.healthhub.repository.PatientRepository;
```

```
import org.springframework.beans.factory.annotation.Autowired;
import org.springframework.stereotype.Service;

import java.util.List;

@Service
public class PatientService {

    @Autowired
    private PatientRepository repository;

    public Patient save(Patient patient){
        return repository.save(patient);
    }

    public List<Patient> getAll(){
        return repository.findAll();
    }

    public Patient getById(Long id){
        return repository.findById(id).orElse(null);
    }

    public void delete(Long id){
        repository.deleteById(id);
    }
}
```

CHANDIGARH UNIVERSITY
Discover. Learn. Empower.

Learning Outcome:

- **Develop a Spring Boot application**
  Create and run a basic Spring Boot project and understand its role in modern backend development.
- **Apply Inversion of Control (IoC) and Dependency Injection (DI)**
  Implement IoC and DI concepts using Spring annotations such as @Autowired, @Service, and @Repository to manage dependencies efficiently.
- **Design applications using Layered Architecture**
  Structure backend applications into Controller, Service, and Repository layers, ensuring proper separation of concerns and maintainable code.
- **Create RESTful APIs with CRUD functionality**
  Develop REST APIs using appropriate HTTP methods (GET, POST, PUT, DELETE) to perform Create, Read, Update, and Delete operations.
- **Implement DTO-based data transfer**
  Use Data Transfer Objects (DTOs) to separate internal entity models from API request and response structures.
